How to patch WPA2 wireless security vulnerability on Windows 7

1. Click on the Windows icon on the bottom left corner of the screen to open the start menu.
2. On the right column of the menu, click “Control Panel.” The Control Panel window should then open.
3. In the top right corner of the Control Panel window, type “Windows Update”.
4. Under the “Windows Update” header, it should say “Check for updates.” Click “Check for updates.”
5. On the left hand side of the following screen, click “Check for updates.” The system will then look for updates.
6. After updates have installed, restart your computer.
7. Repeat steps one through six until Windows says that no updates are available.
8. To verify that you have installed the WPA2 security patch, click on “View update history” on the left side of the Windows Update window.
9. You will now see your update history. At the end of each name in the “Name” column, there will be some text in parentheses. If you see either KB4041681 OR KB4041678 at the end of any of the name columns, then the proper updates have been installed. If not, contact ITS immediately.
